Excellence through continuous performance

The CR Mixer is a powerful yet compact mixing machine, with a proven system of twin concentric rotor blades able to deliver consistent results on a continuous basis. The rotors are mounted on a central drive and positioned to mesh closely with three static, water-cooled elements to create a precision mixing or aeration process.

The unique patented design allows a directional flow of ingredients, giving a far larger mixing surface area, which produces a more uniform mix and a finer bubble size. The mixer can be operated manually or as part of an automated system. The CR also has the facility to inject additives during mixing.
